

Testing Review

Modify XTC 190rds Mid Capacity Magazine for M16/M4 Series AEG

Below is the testing review from U.S.A customer:

Here's what my tech wrote regarding the XTC Magazine

So far so good.

1. Loading:

Loading to the 190rd capacity is no problem, the spring tension felt the same all the way through.

2. Feeding:

Locks in and feeds fine on the guns we have here. I made sure to break it in first and also put a dab of silicone oil on the follower. Before breaking in I did have a bunch of skipped shots when doing mag dumps. After it broke in that went away.

Feeds fine on semi, doing full mag dump I got 3 or 4 skipped shots total out of a VFC gun with a high discharge brick lipo (22+ rps). I don't have a higher speed gun to test on. It will feed all the rounds in the magazine and occasionally leave 1 BB on the follower. Fired about 2000rds through the sample mags and performs the same after the initial break in. I used 3 different guns (Genesis, Troy, VFC)

3. Fitment:

Inserting the mag will take a little bit of effort since it's a tight fit. Once in there are no wobbles whatsoever. I have not filed any magazines yet because they fit on our guns. They will not drop freely as is though.
